RESEARCH OVERVIEW / VERSION 1.0.0

Universal Intelligence Evolution and Relay Unit (UIERU)

Composable intelligence organization · Forward guidance · Structural relay · Validated evolution

KEY IDEA

UIERU proposes a reusable organizational unit for coordinating existing human, AI, agent, model, and service capabilities. It connects executable action with forward-looking evaluation, evidence-preserving handoff, and independently validated structural improvement. It is an engineering and research architecture—not a new foundation model or a claim of demonstrated general intelligence.

CANONICAL UNIT

U = (K, P, F, R, E)	A governed, composable intelligence unit
K · Contract	Authority, goals, constraints, acceptance
P · Calling Path	Execution route and delegation
F · Scoring Forest	Forward guidance and evaluation
R · Relay	Portable evidence and receiver validation
E · Evolution	Tested structural change and rollback

RESEARCH SCOPE

Core mechanisms: Calling Path–Scoring Forest duality; forward-guided and multi-trail execution; sandbox counter-evidence; nested/federated composition; structural relay and bidirectional collective learning; residual-driven Structural RSI.

Three extensions: subject-indexed world models and structural memory; large-scale “Big Animal” platform intelligence organization; subject sovereignty and collective intelligence ecosystems.

REPOSITORY CONTENTS

10 Core research papers	3 Research extensions	3 Illustrative cases
4 Engineering specifications	8 Conceptual figure topics	16 Testable hypotheses

VALIDATION & RESEARCH STATUS

The repository defines open questions, testable hypotheses, comparative baselines, conformance checks, and a staged validation roadmap. Structural change is not automatically verified intelligence improvement. Proposed benefits require controlled, reproducible evaluation; no completed performance validation is claimed.
